

Security memo

Security findings *that matter*

For example.com

The public site exposes a small number of real issues, led by legacy TLS support and missing browser hardening headers.

Generated from live subdomain, host, port, crawl, vulnerability, and TLS checks.

Analysis at a glance

Executive summary and immediate owner actions

Executive summary

The public site exposes a small number of real issues, led by legacy TLS support and missing browser hardening headers.

Priority actions

- 1

Disable TLS 1.0 and TLS 1.1 on the public endpoint.
- 2

Add HSTS and Content-Security-Policy to the main application.
- 3

Re-run the scan after remediation to confirm the fixes.

Detailed Findings

2 items detected

HIGH

Finding #1

Weak TLS settings remain enabled

Older encryption settings can weaken transport security for visitors.

Category: Tls

ID: weak_tls

Affected: https://example.com:443

Evidence: testssl flagged TLS 1.0 as offered on example.com.

Remediation

- 1 Disable TLS 1.0 and TLS 1.1.
- 2 Allow only modern ciphers.
- 3 Run another TLS scan to verify the change.

MEDIUM

Finding #2

Important browser security headers are missing

Missing browser protections can make attacks easier if another flaw is present.

Category: Headers

ID: missing_headers

Affected: https://example.com

Evidence: nuclei reported missing security headers on the main site.

Remediation

- 1 Add HSTS and Content-Security-Policy.
- 2 Validate headers on primary routes.
